

In Vitro Fertilization (IVF)

In vitro fertilization (IVF) is a process of fertilization where an egg is combined with sperm outside the body, in vitro. In standard IVF, embryos are grown under very strictly controlled conditions in the laboratory for two or three days. They are then transferred into the woman's uterus (womb) and any additional embryos can be frozen for future use. The procedure is carried in a well-equipped laboratory under the guidance of well-trained medical staff. This process starts by collecting sperm from the male body and taking eggs from the female body at the same time. The eggs are fertilized through an advanced lab process and allowed to develop the embryos in incubators in an environment replicating the human body. Then these embryos are transferred to the uterus for implantation and growing into a baby. Then after 14 days, the pregnancy test is done to confirm the pregnancy.
